Proven...Process...Performance

JMS sturdy Mega-WALL (Baffle System) baffles and weirs are used in flocculators, aerators, clarifiers, and other tanks to improve flow patterns and/or retention time, increasing system efficiency. Designed for flexibility, they can be used in circular or rectangular basins or tanks and in concrete or steel structures. Depending on end use needs flow options include over-under, serpentine, around, and through with ported baffles.

All components are manufactured of stainless steel with profile design for added strength. Slotted stacking system support frames are fully welded and allow for ease in sliding the panels securely into place. With varied applications, experienced JMS designers can customize the design to suit most systems.

Advantages: Mega-WALL

Process Advantages

- Manage water flow for improved efficiency
- Extend contact time for greater process control
- Minimize short circuiting, and/or prevent channeling
- Plate length of up to 12 feet, can be customized

Maintenance Advantages

- Corrosion resistant
- Panel designs for easy installation and flexibility

Experience Advantages

- JMS is a leading supplier of water and wastewater treatment equipment with thousands of successful applications
- Utilizes proven design enhancements critical to system longevity
- System designs are based on numerous installations and field testing

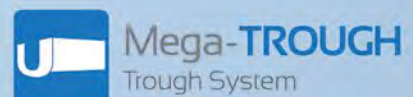

System Integration

In addition to Mega-WALL, JMS expertise extends to a host of other products and systems listed at right. Having such a broad and varied range of experience means your water and wastewater needs, whether individual component or full system, are understood. Optimized efficiency and process performance are yours for the asking. **Contact JMS today.**
